matlab-package

MATLAB Emulation Functions

Description

Wrapper functions and variables used to replicate MATLAB function calls as best possible to simplify porting.

Details

Package: matlab Type: Package Version: 0.8.9 Date: 2011-09-29

License: See COPYING for license information

ceil 3

They are no more complete than absolutely necessary and are quite possibly broken for fringe cases. For a complete list of functions, use library(help="matlab"). For a high-level summary of the changes for each revision, use file.show(system.file("NEWS", package="matlab")).

Note

In certain cases, these may not correspond exactly with MATLAB API as sometimes it just wasn't possible.

Author(s)

P. Roebuck openced

ceil

MATLAB ceil function

Description

Rounds to the nearest integer.

Usage

ceil(x)

Arguments

Х

numeric to be rounded

Details

Simply invokes ceiling for those more used to C library API name.

Value

Returns numeric vector containing smallest integers not less than the corresponding elements of argument x.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

fix, Round

```
ceil(c(0.9, 1.3, 2.4))
```

4 colorbar

cell

MATLAB cell function

Description

Create cell array.

Usage

```
cell(...)
```

Arguments

... numeric dimensions for the result

Value

Returns list consisting of empty matrices. Defaults to square if dimension argument resolves to a single value.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
ones, zeros
```

Examples

```
cell(3)
cell(c(3, 3)) # same thing
cell(3, 3) # same thing
cell(size(matrix(NA, 3, 3))) # same thing
```

colorbar

MATLAB colorbar function

Description

Displays colorbar showing the color scale.

Usage

```
\verb|colorbar(C, location=c("EastOutside", "WestOutside", "NorthOutside", "SouthOutside"), \ldots)| \\
```

colorbar 5

Arguments

C numeric vector or matrix representing data values

location character scalar indicating desired orientation with respect to the axes

graphical parameters for image may also be passed as arguments to this method

Details

The values of the elements of C are indices into the current palette that determine the color of each patch.

This implementation differs a bit from its MATLAB counterpart in that the values must be passed explicitly.

X11(width=8, height=7)
doPlot(values, "EastOutside", col=jet.colors(16))
```

eye

MATLAB eye function

Description

Create an identity matrix.

Usage

```
eye(m, n)
```

Arguments

m, n

numeric scalar specifying dimensions for the result

Value

Returns matrix of order 1. Defaults to square if second dimension argument n not provided.

Author(s)

P. Roebuck proebuck@mdanderson.org>

factors 7

See Also

```
ones, zeros
```

Examples

eye(3)

factors

MATLAB factor function

Description

Performs prime factorization.

Usage

```
factors(n)
```

Arguments

n

numeric scalar specifying composite number to be factored

Details

Computes the prime factors of n in ascending order, each one as often as its multiplicity requires, such that n == prod(factors(n)).

Value

Returns vector containing the prime factors of n.

Note

The corresponding MATLAB function is called 'factor', but was renamed here to avoid conflict with R's compound object class.

Author(s)

 $H.\ Borchers \verb|<hwborchers@googlemail.com>|, P.\ Roebuck \verb|proebuck@mdanderson.org>|$

factors(65537)  # is prime
## Euler's calculation
factors(2^32 + 1)  # 641 6700417
```

8 fileparts

fileparts

MATLAB fileparts function

Description

Return filename parts.

Usage

```
fileparts(pathname)
```

Arguments

pathname

character string representing pathname to be parsed

Details

Determines the path, filename, extension, and version for the specified file. The returned ext contains a dot (.) before the file extension. The returned versn is always an empty string as the field is provided for compatibility with its namesake's results.

Value

Returns a list with components:

pathstr character string representing directory path
name character string representing base of file name
ext character string representing file extension
versn character string representing version. Unused

Note

Returns same insane results as does its namesake when handling relative directories, UNIX hidden files, and tilde expansion. Hidden files are returned with name containing a zero length vector and ext containing the actual name. For best results, use this routine to process files, not directories.

Author(s)

P. Roebuck proebuck@mdanderson.org>

## Rename dot-txt file as dot-csv
ans <- fileparts("/home/luser/foo.txt")
fullfile(ans$pathstr, paste(ans$name, "csv", sep=".")) # /home/luser/foo.csv</pre>
```

filesep 9

filesep

MATLAB filesep function

Description

Returns the character that separates directory names in filenames.

Usage

filesep

Details

Variable that contains the value of .Platform\$file.sep.

Value

Returns character representing this platform's file separator.

Note

Implemented as an R variable rather than a function such that it more closely resembles normal MATLAB usage.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
fileparts, fullfile, pathsep
```

find

MATLAB find function

Description

Finds indices of elements.

Usage

find(x)

Arguments

Χ

expression to evaluate

10 fix

Details

If expression is not logical, finds indices of nonzero elements of argument x.

Value

Returns indices of corresponding elements matching the expression x.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
find(-3:3 \ge 0)
find(c(0, 1, 0, 2, 3))
```

fix

MATLAB fix function

Description

Rounds toward zero.

Usage

fix(A)

Arguments

Α

numeric to be rounded

Details

Simply invokes trunc.

Value

Returns vector containing integers by truncating the corresponding values of argument A toward zero.

Author(s)

P. Roebuck opence

See Also

```
ceil, Round
```

fliplr 11

Examples

```
fix(c(1.3, 2.5, 3.7))
```

fliplr

MATLAB matrix flip functions

Description

Flips matrices either left-right or up-down.

Usage

```
fliplr(object)
flipud(object)
```

Arguments

object

vector or matrix to be flipped

Details

These are S4 generic functions.

Value

Return value is the same type as argument object.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

rot90

```
fliplr(1:9)
flipud(1:9) # same as previous since vectors have no orientation in R
fliplr(matrix(1:9, 3, 3, byrow=TRUE))
flipud(matrix(1:9, 3, 3, byrow=TRUE))
```

12 fullfile

fullfile

MATLAB fullfile function

Description

Contructs path to a file from components in platform-independent manner

Usage

```
fullfile(...)
```

Arguments

... character strings representing path components

Details

Builds a full filename from the directories and filename specified. This is conceptually equivalent to

```
paste(dir1, dir2, dir3, filename, sep=filesep)
```

with care taken to handle cases when directories begin or end with a separator.

Value

Returns character vector of arguments concatenated term-by-term and separated by file separator if all arguments have a positive length; otherwise, an empty character vector.

Author(s)

P. Roebuck openced

See Also

```
fileparts, filesep
```

```
fullfile("", "etc", "profile") # /etc/profile
```

hilb 13

hilb

MATLAB hilb function

Description

Create a Hilbert matrix.

Usage

hilb(n)

Arguments

n

numeric scalar specifying dimensions for the result

Details

The Hilbert matrix is a notable example of a poorly conditioned matrix. Its elements are

```
H[i, j] = 1 / (i + j - 1)
```

.

Value

Returns an n-by-n matrix constructed as described above.

Author(s)

H. Borchers <hwborchers@googlemail.com>, P. Roebuck cproebuck@mdanderson.org>

Examples

hilb(3)

imagesc

MATLAB imagesc function

Description

Scales image data to the full range of the current palette and displays the image.

Usage

```
imagesc(x=seq(ncol(C)), y=seq(nrow(C)), C, col=jet.colors(12), ...)
```

14 isempty

Arguments

x,y	locations of grid lines at which the values in C are measured. These must be finite, non-missing and in (strictly) ascending order. By default, the dimensions of C are used.
С	numeric matrix representing data to be plotted. Note that \boldsymbol{x} can be used instead of C for convenience.
col	vector of colors used to display image data
	graphical parameters for image may also be passed as arguments to this method

Details

Each element of C corresponds to a rectangular area in the image. The values of the elements of C are indices into the current palette that determine the color of each patch.

The method interprets the matrix data as a table of f(x[i], y[j]) values, so that the x axis corresponds to column number and the y axis to row number, with row 1 at the top, i.e., the same as the conventional printed layout of a matrix.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
image, jet.colors, par
```

Examples

isempty

MATLAB isempty function

Description

Determine if object is empty.

Usage

```
isempty(A)
```

Arguments

Α

object to evaluate

isprime 15

Details

An empty object has at least one dimension of size zero.

Value

Returns TRUE if x is an empty object; otherwise, FALSE.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
isempty(1:3) # FALSE
isempty(array(NA, c(2, 0, 2))) # TRUE
```

isprime

MATLAB isprime function

Description

Array elements that are prime numbers.

Usage

```
isprime(x)
```

Arguments

Χ

numeric vector or matrix containing nonnegative integer values

Value

Returns an array (or vector) the same size as x containing logical 1 (true) for the elements of x which are prime, and logical 0 (false) otherwise.

Author(s)

H. Borchers hwborchers@googlemail.com, P. Roebuck proebuck@mdanderson.org

See Also

```
factors, primes
```

```
x \leftarrow c(2, 3, 0, 6, 10)
ans \leftarrow isprime(x) \# 1, 1, 0, 0, 0
as.logical(ans) \# true, true, false, false
```

linspace

jet.colors

MATLAB jet function

Description

Creates a vector of n colors beginning with dark blue, ranging through shades of blue, cyan, green, yellow and red, and ending with dark red.

Usage

```
jet.colors(n)
```

Arguments

n

numeric scalar specifying number of colors to be in the palette

Value

Returns vector of n color names. This can be used either to create a user-defined color palette for subsequent graphics, a col= specification in graphics functions, or in par.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
palette, par, rgb
```

Examples

```
require(graphics)
x <- 1:16
pie(x, col=jet.colors(length(x)))</pre>
```

linspace

MATLAB linspace function

Description

Generate linearly spaced vectors.

Usage

```
linspace(a, b, n=100)
```

logspace 17

Arguments

a	numeric scalar specifying starting point
b	numeric scalar specifying ending point

n numeric scalar specifying number of points to be generated

Details

Similar to colon operator but gives direct control over the number of points. Note also that although MATLAB doesn't specifically document this, the number of points generated is actually floor(n).

Value

Returns vector containing containing n points linearly spaced between a and b inclusive. If n < 2, the result will be the ending point b.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

logspace

Examples

```
linspace(1, 10, 4)
```

logspace

MATLAB logspace function

Description

Generate logarithmically spaced vectors.

Usage

```
logspace(a, b, n=50)
```

Arguments

a	numeric scalar specifying exponent for starting point
b	numeric scalar specifying exponent for ending point
n	numeric scalar specifying number of points to be generated

Details

Useful for creating frequency vectors, it is a logarithmic equivalent of linspace.

18 magic

Value

Returns vector containing containing n points logarithmically spaced between decades 10^{a} and 10^{b} . For n < 2, b is returned.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

linspace

Examples

```
logspace(1, pi, 36)
```

magic

MATLAB magic function

Description

Create a magic square.

Usage

magic(n)

Arguments

n

numeric scalar specifying dimensions for the result

Details

The value of the characteristic sum for a magic square of order n is $sum(1:n^2)/n$. The order n must be a scalar greater than or equal to 3; otherwise, the result will be either a nonmagic square, or else the degenerate magic squares 1 and [].

Value

Returns an n-by-n matrix constructed from the integers 1 through ${\cal N}^2$ with equal row and column sums.

Note

A magic square, scaled by its magic sum, is doubly stochastic.

Author(s)

P. Roebuck proebuck@mdanderson.org>

meshgrid 19

See Also

```
ones, zeros
```

Examples

magic(3)

meshgrid

MATLAB meshgrid functions

Description

Generate X and Y matrices for three-dimensional plots.

Usage

```
meshgrid(x, y, z, nargout=2)
```

Arguments

x, y, z numeric vectors of values

nargout numeric scalar that determines number of dimensions to return

Details

In the first example below, the domain specified by vectors x and y are transformed into two arrays which can be used to evaluate functions of two variables and three-dimensional surface plots. The rows of the output array x are copies of the vector x; columns of the output array y are copies of the vector y.

The second example below is syntactic sugar for specifying meshgrid(x, x).

The third example below produces three-dimensional arrays used to evaluate functions of three variables and three-dimensional volumetric plots.

Value

Returns list containing eiher two or three matrices depending on the value of nargout.

```
x, y, z output matrices
```

Note

Limited to two- or three-dimensional Cartesian space.

Author(s)

P. Roebuck proebuck@mdanderson.org>

20 mod

Examples

```
meshgrid(1:3, 10:14)  # example 1
meshgrid(1:3)  # example 2
meshgrid(5:8, 10:14, 2:3, 3)  # example 3
```

mod

MATLAB mod/rem functions

Description

Provides modulus and remainder after division.

Usage

```
mod(x, y)

rem(x, y)
```

Arguments

х, у

numeric vectors or objects

Value

Returns vector containing result of the element by element operations.

Author(s)

P. Roebuck proebuck@mdanderson.org>

```
## same results with x, y having the same sign mod(5, 3) rem(5, 3) ## same results with x, y having different signs mod(-5, 3) rem(-5, 3)
```

multiline.plot.colors 21

```
multiline.plot.colors MATLAB multiline plot colors
```

Description

Creates a vector of colors equivalent to MATLAB's default colors to use for multiline plots.

Usage

```
multiline.plot.colors()
```

Details

This is equivalent to the MATLAB command

```
get(gca, 'ColorOrder')
```

Value

Returns vector of color names. This can be used either to create a user-defined color palette for subsequent graphics, a col= specification in graphics functions, or in par.

Note

Method should be considered experimental and will most likely be removed and replaced with similar functionality in the near future.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
palette, par, rgb
```

```
require(graphics)
x <- matrix(1:16, nrow=2, byrow=TRUE)
matplot(x, type="1", col=multiline.plot.colors())</pre>
```

22 ndims

ndims

MATLAB ndims function

Description

Provides number of array dimensions.

Usage

```
ndims(A)
```

Arguments

Α

object of which to determine the number of dimensions

Details

```
Simply invokes length(size(A)).
```

Value

Returns the number of dimensions in the array A.

Note

The number of dimensions is always greater than or equal to 2. Initial implementation returned length.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

size

```
ndims(2:9) # 2
ndims(magic(4)) # 2
ndims(array(1:8, c(2,2,2))) # 3
```

nextpow2 23

nextpow2

MATLAB nextpow2 function

Description

Smallest power of 2 greater than or equal to its argument.

Usage

```
nextpow2(x)
```

Arguments

Х

numeric or complex value(s).

Details

Computes the smallest power of two that is greater than or equal to the absolute value of x. (That is, p that satisfies $2^p \ge abs(x)$). For negative or complex values, the absolute value will be taken.

Value

Returns numeric result containing integer p as described above. Nonscalar input returns an element-by-element result (of same size/dimensions as its input).

Author(s)

H. Borchers <hwborchers@googlemail.com>, P. Roebuck cproebuck@mdanderson.org>

See Also

pow2

```
nextpow2(10)  # 4
nextpow2(1:10)  # 0 1 2 2 3 3 3 3 4 4
nextpow2(-2^10)  # 10
nextpow2(.Machine$double.eps)  # -52
nextpow2(c(0.5, 0.25, 0.125))  # -1 -2 -3
```

24 ones

numel

MATLAB numel function

Description

Provides number of elements in array A or subscripted array expression.

Usage

```
numel(A, varargin)
```

Arguments

A object of which to determine the number of elements

varargin unimplemented

Value

```
Returns prod(size(A)).
```

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
prod, size
```

Examples

```
numel(2:9) # 8
numel(magic(4)) # 16
```

ones

MATLAB ones/zeros functions

Description

Create a matrix consisting of all ones or zeros.

Usage

```
ones(...)
zeros(...)
```

padarray 25

Arguments

... numeric dimensions for the result

Value

Returns matrix consisting only of ones (or zeros). Defaults to square if dimension argument resolves to a single value.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

eye

Examples

padarray

MATLAB padarray function

Description

Pad array.

Usage

```
padarray(A, padsize, padval=0, direction=c("both", "pre", "post"))
```

Arguments

A vector, matrix, or array to be padded

padsize integer vector specifying both amount of padding and the dimension along which

to add it

padval scalar value specifying pad value, which defaults to 0.

Instead, it may specify the method used to determine pad values.

Valid values for the method are:

"circular" pad with circular repetition of elements within the dimension

"replicate" pad by repeating border elements of array symmetric" pad array with mirror reflections of itself

26 pascal

```
direction character string specifying direction to apply padding.

Valid values are:

"both" pad before first element and after last array element along each dimension pad after last array element along each dimension pad before first array element along each dimension
```

Details

This is an S4 generic function.

Value

Return value is the same type as argument A with requested padding.

Author(s)

P. Roebuck opence

Examples

```
padarray(1:4, c(0, 2)) # 0 0 [1 2 3 4] 0 0
padarray(1:4, c(0, 2), -1) # -1 -1 [1 2 3 4] -1 -1
padarray(1:4, c(0, 2), -1, "post") # [1 2 3 4] -1 -1
padarray(1:4, c(0, 3), "symmetric", "pre") # 3 2 1 [1 2 3 4]
padarray(letters[1:5], c(0, 3), "replicate") # a a a [a b c d e] e e e
padarray(letters[1:5], c(0, 3), "circular", "post") # [a b c d e] a b c
```

pascal

MATLAB pascal function

Description

Generate Pascal matrix.

Usage

```
pascal(n, k=0)
```

Arguments

```
n numeric scalar specifying order
```

k numeric scalar specifying desired option. Valid values are 0, 1, or 2

pathsep 27

Details

Specifying k=0 returns symmetric positive definite matrix with integer entries taken from Pascal's triangle.

Specifying k=1 returns the lower triangular Cholesky factor (up to the signs of the columns) of the Pascal matrix.

Specifying k = 2 returns a cube root of the identity matrix.

Value

Returns matrix of order n according to specified option k.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
pascal(4)
pascal(3, 2)
```

pathsep

MATLAB pathsep function

Description

Returns the character that separates directory names in a list such as the PATH environment variable.

Usage

pathsep

Details

Variable that contains the value of .Platform\$path.sep.

Value

Returns character representing this platform's path separator.

Note

Implemented as an R variable rather than a function such that it more closely resembles normal MATLAB usage.

Author(s)

P. Roebuck proebuck@mdanderson.org>

28 pow2

See Also

filesep

pow2

MATLAB pow2 function

Description

Power with base 2.

Usage

```
pow2(f, e)
```

Arguments

f numeric vector of factors

e numeric vector of exponents for base 2

Details

Computes the expression $f * 2^e$ for corresponding elements of f and e. If e is missing, it sets e to f and f to 1. Imaginary parts of complex values are ignored unless e is missing.

Value

Returns numeric vector constructed as described above.

Author(s)

H. Borchers <hwborchers@googlemail.com>, P. Roebuck proebuck@mdanderson.org>

```

primes 29

primes

MATLAB primes function

Description

Generate a list of prime numbers.

Usage

```
primes(n)
```

Arguments

n

scalar numeric specifying largest prime number desired.

Details

Generates the list of prime numbers less than or equal to n using a variant of the basic "Sieve of Eratosthenes" algorithm. This approach is reasonably fast, but requires a copious amount of memory when n is large. A prime number is one that has no other factors other than 1 and itself.

Value

Returns numeric vector containing prime numbers less than or equal to argument n.

Author(s)

H. Borchers <hwborchers@googlemail.com>, P. Roebuck proebuck@mdanderson.org>

  length(primes(1e8))  # 5761455 prime numbers less than one hundred million
## End(Not run)
```

repmat repmat

repmat

MATLAB repmat function

Description

Replicate and tile a matrix.

Usage

```
repmat(A, ...)
```

Arguments

A vector or matrix to be tiled. Must be numeric, logical, complex or character.

... numeric dimensions for the result

Value

Returns matrix with value A tiled to the number of dimensions specified. Defaults to square if dimension argument resolves to a single value.

Author(s)

P. Roebuck openced

See Also

```
ones, zeros
```

```
repmat(1, 3)  # same as ones(3)
repmat(1, c(3, 3))  # same thing
repmat(1, 3, 3)  # same thing
repmat(1, size(matrix(NA, 3, 3))) # same thing
repmat(matrix(1:4, 2, 2), 3)
```

reshape 31

reshape

MATLAB reshape function

Description

Reshape matrix or array.

Usage

```
reshape(A, ...)
```

Arguments

A matrix or array containing the original data

... numeric dimensions for the result

Details

In the first example below, an m-by-n matrix is created whose elements are taken column-wise from A. An error occurs if A does not have m*n elements.

In the second example below, an n-dimensional array with the same elements as A but reshaped to have the size m-by-n-by-p. The product of the specified dimensions must be the same as prod(size(A)).

In the third example below, an n-dimensional array with the same elements as A but reshaped to siz, a vector representing the dimensions of the reshaped array. The quantity prod(siz) must be the same as prod(size(A)).

Value

Returns matrix (or array) of requested dimensions containing the elements of A.

Author(s)

P. Roebuck opence

32 rot90

rosser

MATLAB rosser function

Description

Create the Rosser matrix, a classic symmetric eigenvalue test problem.

Usage

```
rosser()
```

Details

The returned matrix has the following features:

- a double eigenvalue
- three nearly equal eigenvalues
- dominant eigenvalues of opposite sign
- a zero eigenvalue
- a small, nonzero eigenvalue

Value

Returns an 8-by-8 matrix with integer elements.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
rosser()
```

rot90

MATLAB rot90 function

Description

Rotates matrix counterclockwise k*90 degrees.

Usage

```
rot90(A, k=1)
```

size 33

Arguments

A matrix to be rotated

k numeric scalar specifying the number of times to rotate (1..4)

Details

Rotating 4 times (360 degrees) returns the original matrix unchanged.

Value

Returns matrix corresponding to argument A having been rotated argument k number of times.

Author(s)

P. Roebuck proebuck@mdanderson.org>

See Also

```
fliplr, flipud
```

Examples

```
rot90(matrix(1:4, 2, 2))
```

size

MATLAB size function

Description

Provides dimensions of X.

Usage

```
size(X, dimen)
```

Arguments

X vector, matrix, or array object

dimen numeric scalar specifies particular dimension

Details

This is an S4 generic function. Vector will be treated as a single row matrix. Stored value is equivalent to dim.

34 size_t-class

Value

Returns object of class size_t containing the dimensions of input argument X if invoked with a single argument. Returns integer value of specified dimension if invoked with two arguments. If dimen specifies a higher dimension than exists, returns 1 representing the singleton dimension.

Note

Handling of vectors is different than in initial implementation. Initial implementation returned length.

Author(s)

P. Roebuck opence

Examples

```
size(2:9) # 1 8
size(matrix(1:8, 2, 4)) # 2 4
size(matrix(1:8, 2, 4), 2) # 4
size(matrix(1:8, 2, 4), 3) # 1
```

size_t-class

Class "size\ t"

Description

This class represents the dimensions of another R object

Objects from the Class

Objects can be created by calls of the form $new("size_t", ...)$. Use of generator method is preferred.

Slots

.Data: object of class "integer" containing size values

Extends

Class "integer", from data part. Class "vector", by class "integer". Class "numeric", by class "integer".

Note

Internal class supporting size.

Author(s)

P. Roebuck proebuck@mdanderson.org>

std 35

std

MATLAB std function

Description

Computes the standard deviation of the values of x.

Usage

```
std(x, flag=0)
```

Arguments

x numeric vector or matrix

flag numeric scalar. If 0, selects unbiased algorithm. If 1, selects biased algorithm

(currently unsupported).

Details

Simply invokes sd.

Value

Return value depends on argument x. If vector, returns the standard deviation. If matrix, returns vector containing the standard deviation of each column.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
std(1:2) ^ 2
```

strcmp

MATLAB stremp function

Description

Compare strings.

Usage

```
strcmp(S, T)
```

36 sum

Arguments

S, T character vectors to evaluate

Details

Comparisons are case-sensitive and any leading and trailing blanks in either of the strings are explicitly included in the comparison.

Value

Returns TRUE if S is identical to T; otherwise, FALSE.

Note

Value returned is the opposite of the C language convention.

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
strcmp("foo", "bar") # FALSE
strcmp(c("yes", "no"), c("yes", "no")) # TRUE
```

sum

MATLAB sum function

Description

Provides sum of elements.

Usage

```
sum(x, na.rm=FALSE)
```

Arguments

x numeric or logical to be summedna.rm logical scalar. If TRUE, remove missing values

Details

This is an S4 generic function.

Value

Return value depends on argument x. If vector, returns the same as sum. If matrix, returns vector containing the sum of each column.

tictoc 37

Author(s)

P. Roebuck proebuck@mdanderson.org>

Examples

```
sum(1:9)
sum(matrix(1:9, 3, 3))
```

tictoc

MATLAB timer functions

Description

Provides stopwatch timer. Function tic starts the timer and toc updates the elapsed time since the timer was started.

Usage

```
tic(gcFirst=FALSE)
toc(echo=TRUE)
```

Arguments

gcFirst logical scalar. If TRUE, perform garbage collection prior to starting stopwatch echo logical scalar. If TRUE, print elapsed time to screen

Details

Provides analog to system. time. Function toc can be invoked multiple times in a row.

Author(s)

P. Roebuck proebuck@mdanderson.org>

```
tic()
for(i in 1:100) mad(runif(1000)) # kill time
toc()
```

38 vander

vander

MATLAB vander function

Description

Generate Vandermonde matrix from a vector of numbers.

Usage

```
vander(v)
```

Arguments

٧

numeric or complex vector of values

Details

Generates the Vandermonde matrix whose columns are powers of the vector \boldsymbol{v} (of length n) using the formula

$$A[i, j] = v[i]^{(n-j)}$$

Used when fitting a polynomial to given points.

Value

Returns an n-by-n matrix constructed as described above.

Author(s)

H. Borchers <hwborchers@googlemail.com>, P. Roebuck cproebuck@mdanderson.org>

```
vander(1:5)
```
